---

New release of Ghost Installer is here. Apart from several bugfixes (including corrected Windows Vista manifest), new version has several new features:

- Visual Studio 2008 are now supported by the wizards
- Multiple .Net assemblies can be added in one operation
- Added support for Windows Server 2008

**NOTE:** If your application is installed into Program Files or the installation performs other operations that cannot be done from a limited user account, you have to set "Administrative rights are required..." flag in Project Settings > Miscellaneous.
